PURPOSE

The purpose of this report is to compile completed studies on the economic impact of wind farms in rural communities and then to compare these studies. By summarizing the studies in an Excel spreadsheet, the raw data from a study is easily compared with the data from other studies. In this way, graphs can be made and conclusions drawn. Additionally, the creation of a database in which economic impact studies are summarized allows a greater understanding of the type of information gathered in an economic impact study, the type of information that is most helpful in using these studies to promote wind energy development in rural communities, and the limitations on collecting data for these studies.

These studies were conducted in many different fashions, so it was sometimes difficult to use the same template for all studies. For this reason, some of the categories on each spreadsheet may be slightly different from others.

METHODOLOGY

The majority of the studies in this report were compiled via Internet searches, although some were obtained from Steven Clemmer of the Union of Concerned Scientists. Twenty-one studies were collected; however, only 13 were included in this report (some of which have multiple parts) because some of the studies lacked actual numerical data that could be entered into the cover page spreadsheet. These individual cover pages are intended to serve as a cover page for the study or as a stand-alone for the purpose of comparison to other cover pages.

The studies included in this report were entered into a template spreadsheet consisting of a summary checklist, as well as the following categories:

Citation: the full title of the report, including author(s) and date completed

Online availability: the URL where the study can be located **Description:** project size and number of turbines, if applicable

Location: geographic location of the project

Geographic scope of the study: the area of impact considered (local or state)

Turbine ownership: the company that owns the turbines, if applicable

Type of study: indicates whether the study is based on predictions for a prospective wind installation (pre-project), actual data for an existing wind installation (post-project), or the estimated impact of installing a set amount of wind energy (prospective)

Timeframe of data: the timeframe considered by the study

Methodology: includes the model and data sources, as well as any assumptions

Special considerations: any considerations that may impact conclusions drawn from the study

Jobs: the direct, indirect, induced, and total number of jobs created throughout the geographic scope of the study by the wind installation under consideration. Also includes jobs per megawatt, if applicable. The construction jobs are generally one-time jobs, while the operations jobs are generally annual jobs

Income: the amount of direct, indirect, induced, and total income created by the wind installation under consideration. Construction income is generally a one-time number, while operations income is generally an annual number

Taxes: the amount of local/state, income, property, sales, and total taxes accruing as a result of the wind installation under consideration

Developer incentives: incentives made available to the wind farm developer, if applicable

Lease payments: indicates the amount paid to landowners leasing their lands to the wind project developer. This is generally an averaged number, as the amount of most lease payment contracts is confidential

Other remuneration: lists remuneration other than lease payments to landowners **Conclusion:** the conclusion drawn from the study.

Although none of the studies includes information for all the categories listed in the spreadsheet, these categories represent the wide range of information available in the many different studies compiled, and ideally, what elements would be included in future studies.

TYPES OF STUDIES COLLECTED

The studies collected for this report represent several different types of economic impact studies. Some of the studies were completed strictly to measure the actual economic impact of a particular wind installation in the county in which it is located. Others were completed to estimate the economic impact of investing in a set amount of wind power within a state or region. Still others compare a fixed investment in wind power to a similar investment in fossil fuels. Finally, some of the studies evaluate the economic impact of implementing a Renewable Portfolio Standard compared to the economic impact of continuing to invest in fossil fuel as a source of energy.

The smaller, more concentrated studies, such as the ECONorthwest study completed for the wind installation planned for Kittitas County, predictably tend to have more specific information, while the larger, comparative studies, such as the Black & Veatch study on the economic impact of renewable energy in Pennsylvania, tend to focus more on the difference between investing in renewable energy versus investing in fossil fuels. Therefore, since the specific purpose of the studies was to discover the economic impacts of wind and is more narrowly defined, these studies generally contain more specific data and are more easily defined within the parameters of the template used in this report. The gaps in the data result from the generally proprietary nature of wind industry data, as well as the differing goals of the many different types of economic impact studies.

All of the studies indicate that investment in wind power creates a positive impact on rural economies in the form of an increase in jobs, income, and taxes.

OVERVIEW OF STUDIES

The following paragraphs summarize the purposes and general findings of the economic impact studies. For more information, please refer to the cover sheets for each study.

"Economic Impacts of Wind Power in Kittitas County: Final Report"

- Estimates the effect of the increase in jobs and local spending on property values, economic impacts, and tax revenues.
 - o Surveyed tax assessors in other counties.
 - o Reviewed available literature on property value effects.
 - Used input-output model with data from two companies proposing wind projects in Kittitas County.
- Findings:
 - O Views of wind turbines will not negatively impact property values.
 - o Wind plant construction will have significant economic benefits.
 - o Wind plant operation will provide additional annual economic benefits.
 - o Property tax revenues will increase.
 - o Tax revenues to Kittitas County Government will increase.

"Renewable Resources: The New Texas Energy Powerhouse: A Report on the Economic Benefits of Renewable Energy in Texas and How to Keep Them Growing"

Part 1a

- Estimates the increase in the number of direct and indirect jobs, payroll value of direct jobs, amount of tax revenue, and amount of landowner royalty income stemming from 912 MW of wind energy installed in 2001 in response to the Texas Renewable Portfolio Standard and the 178 MW of wind energy installed before 2001.
- Explains the benefits of price stability, energy security, and fuel diversity, as well as the public health and environmental benefits associated with wind energy.

Part 1b

- Details the requirements and successes of the Texas Renewable Portfolio Standard.
- Estimates the positive impact of the Texas RPS between 2002 and 2009 in terms of direct and indirect jobs, payroll value of direct jobs, landowner royalties, and local taxes.

Part 1c

- Estimates the impact of requiring that 10% of Texas' energy needs be met by wind power by 2020.
- Includes estimates of the resulting increase in direct and indirect jobs, payroll value of direct jobs, increase in local taxes, and payments to landowners.
- Suggests renewable energy policies to help make Texas a global leader in wind energy.

"Economic Impact Analysis of the Cape Wind Off-Shore Renewable Energy Project"

• Estimates the positive economic and fiscal impacts in mainland cities and towns in Barnstable County and in the Commonwealth of Massachusetts during the manufacturing/assembly (M/A), construction/installation (C/I), and operation phases of the Cape Wind Project.

- Estimates an increase in several sectors during the M/A and C/I phases, including:
 - O Direct, indirect, and induced full-time jobs, total state economic impact, value added, labor income, personal income tax revenues, property income, and corporate income tax revenues.
 - o Indicates that in the long run, there should be no appreciable increase in the demand for locally or state-provided government services.
- Estimates an increase in several sectors during the operation phase, including annual increases in:
 - O Jobs, state economic output, labor income, personal income tax revenues, corporate income tax revenues, and Barnstable and Yarmouth County property tax revenues.
 - o Estimates annual savings in wholesale power costs in New England, which would result in additional economic output and an increase in employment.

"Wind Energy: Powering Economic Development for Colorado"

- Estimates the economic impact of using wind power to meet one-half of Colorado's new energy demand from 2002 through 2012 (part 1a) and three-quarters of Colorado's new energy demand from 2002 through 2020 (part 1b). Compares economic impact of using wind to meet this demand as compared to natural gas.
- Estimates positive impact from wind installations on employment during manufacturing, installation and operation and maintenance phases, indirect employment, landowner revenue, local tax income, avoided water use from displaced conventional energy generation, and electricity pricing impacts.
- Summarizes other state policies supporting wind energy, including those in Texas, Iowa, and Minnesota.
- Suggests implementation of renewable policies, including renewable purchase obligations, tax incentives for renewable energy equipment, and service charges to fund renewable energy development.
- Details Colorado's wind energy potential and summarizes Colorado's renewable energy industry.

"The Economic Benefits of Wind Farm Development in Vermont"

- Estimates the economic impact of producing 10% of Vermont's electric energy from wind energy over a 10-year period.
- Estimates a capital expenditure and the resulting positive economic impact during the development, construction, and operations phases on jobs, earnings, landowner revenue, property tax, business tax, income tax, and sales tax. Includes direct, indirect, and induced impacts.
- Concludes that these wind installations would help spur rural economic development, provide stability in power costs, and possibly attract tourists.

"Strong Winds: Opportunities for Rural Economic Development Blow across Nebraska"

- Analyzes the potential economic benefits and costs of expanding wind power in Nebraska compared to developing coal and natural gas.
- Analysis is based on a policy goal of generating 10% of Nebraska's electricity from wind power by the year 2012 through the implementation of a renewable portfolio standard.

- Finds that developing wind power instead of coal and natural gas:
 - o Benefits the state economy by \$15 million per year over a 20-year period.
 - o Creates more jobs.
 - o Could produce an important source of rural economic development in Nebraska through landowner revenues and property tax revenues.

"Energy for Washington's Economy: Economic Development from Energy Efficiency and Wind Power in Washington"

- Compares the economic impacts of decreasing electricity consumption by 12% (or 1,700 MW) by 2020, as well as installing enough wind turbines to produce 1,700 MW of power by 2020 (or 14% of Washington's power needs), as compared to meeting growing electricity demand with 3,400 MW of natural gas.
- Finds that relying on energy efficiency and wind energy rather than natural gas would:
 - o Create more jobs.
 - o Increase landowner revenue.
 - o Create a stronger tax base.
 - o Use less water.
- Summarizes Washington's energy industry.
- Suggests specific policies that would help Washington realize its efficiency and wind potential, including:
 - o Energy conservation standards.
 - o Renewable energy standards.
 - o Moratorium on issuance of fossil fuel-based power plant permits.
 - Tax incentives.

"Renewables Work: Job Growth from Renewable Energy Development in California"

- Considers the positive economic impacts of adding 5,900 MW (3,700 of which is assumed to be wind) of renewable energy capacity by 2010, which would allow the state to generate 20% of its electricity from renewables. Compares these impacts to those of an equal amount of natural gas installation.
- Finds that investing in renewable energy would create four times as many jobs as investing in natural gas.
- Uses California Energy Commission job creation study to determine specific employment rates for wind, geothermal, solar PV, solar thermal, landfill/digester gas, and natural gas and separates employment rates for the construction and operation phases. Compared projections from CEC study to other job creation studies, as well as real-life experience.
- Makes policy recommendations to encourage renewable energy, including establishment of tax equity, incentives for development and production, and incentives for consumers.

"Pecos County Wind Farms: Local Economic Impact"

- Estimates the positive impact of the wind farms in Pecos County on jobs, gross sales in the county during construction, increased tax base, increased tourism dollars, and development of an industrial park.
- Includes a detailed look at the impact of the wind farms on schools.

"Rural Economic Development Impacts of Wind Power: Foote Creek Rim Projects"

- Analysis of the Foote Creek Rim projects by SeaWest.
- Findings:
 - Wind power projects provide economic benefit to the local community through an increase in higher-than-average-wage jobs, employment diversification, increased property/sales tax revenues, low demand on local government services, and landowner benefits.
 - o Gradual growth over time provides stabilizing effect on farming and ranching industries.

"Economic Impact of Renewable Energy in Pennsylvania"

- Estimates the economic impact of implementing a Renewable Portfolio Standard (RPS) requiring that renewable energy sources generate 10% of Pennsylvania's electricity by the year 2025, 65% of which is assumed to be wind power. The impact of the use of renewable energy is compared with the impact of a "business as usual" approach relying on the development of fossil fuel resources.
- Findings:
 - The RPS portfolio has a significantly larger impact on jobs, income, and economic output when compared to the fossil fuel development scenario. This impact more than makes up for the small increase in electricity bills from investment in the RPS.
 - The cost of the RPS is 36% higher than the cost of the development of fossil fuels; however, "taken in context," the increase in electricity costs would be small per household and more than recouped by the impact of the RPS on jobs, income, and economic output.
 - o Renewable energy resources may lower fuel prices and could therefore save money by decreasing the demand for fossil fuels.

"Potential Economic Impacts of Commercial Wind Power Development in North Dakota"

- Analyzes the potential economic impact of the Griggs/Steele Wind Power project and the statewide impacts of developing 1,000 MW of wind energy over the next 10 years.
- Findings:
 - Wind energy development may provide substantial economic benefits to North Dakota's rural areas and larger communities through creation of jobs, lease/royalty payments for landowners, increased tax revenues, and increased revenue through local purchase of supplies, materials, and services.

"Assessing the Economic Development Impacts of Wind Power: Final Report"

- Provides examples of thorough and consistent analysis and documentation of economic impacts from wind power development. Considers three case studies as examples, including Lake Benton I (Lincoln County, MN), Vansycle Ridge (Morrow and Umatilla Counties, OR), and Delaware Mountain (Culberson County, TX).
- Analyzes the economic impact of each of the wind energy projects on employment, income, taxes, and provision of community services.
- Findings:

- The projects contributed to significant increases in employment, personal income, tax income, and landowner net revenues.
- o Tax effects, particularly property taxes, were important.
- Non-market benefits may be important: wind power is a non-polluting, low impact, and non-extractive form of energy that provides large positive benefits to local economies but has a relatively light impact on communities and their infrastructure (schools, roads, and social services).
- o Wind energy development does not involve the "boom and bust" economic and social conditions associated with other energy development.
- o Considered possible negative impacts of wind energy development, such as bird kills, damages to roads, and impact on land values.

CONCLUSION

Due to the nature of this report and the broad cross-section of data available from each study summarized here, it is difficult to draw specific conclusions about the positive impact of wind installations on local and state economies. However, it is possible to draw several general conclusions:

- Wind installations create a large direct impact on the economies of rural communities, especially those with few supporting industries. For example, in communities in which farming is the only large industry, the installation of wind farms creates another industry that becomes a large percentage of the local tax base and contributes to local businesses.
- Small communities with few large industries see greater leakage of revenue into nearby towns that provide more services. These small communities therefore experience less indirect and induced impact of a wind installation than a larger community with the ability to provide a greater number of services.
- The number of local construction and operations jobs created by a wind installation
 depends upon the skills available in the local community. Many developers try to hire
 local construction companies and local operators; however, when this is not possible,
 developers bring in construction companies and operators from outside the county or
 even outside the state.
- Some local governments offer incentives to developers in return for the developer agreeing to hire local labor.
- Local and state taxes may support sectors of the economy such as schools, hospitals, fire and rescue, or road improvement.
- When compared to fossil fuel development, the development of renewable energy creates
 a larger impact on the economy. According to the Pennsylvania study, this is largely
 because of the additional income earned by Pennsylvanians working in the renewable
 energy industry, which more than makes up for the cost increase required to invest in
 renewable energy.

The wind industry continues to grow, and economic impact studies like those summarized here are continually published on the Internet and elsewhere. Therefore, it is possible to continue building on these initial 13 studies to gain greater access to the information on the positive economic impacts of wind installations on rural communities throughout the United States.

COLLECTED STUDIES

Studies Included in Report

Assessing the Economic Development Impacts of Wind Power: Final Report, Northwest Economic Associates, for the National Wind Coordinating Committee, 2003.

The Economic Benefits of Wind Farm Development in Vermont, Doug Hoffer for Renewable Energy Vermont, 2002.

Economic Impact Analysis of the Cape Wind Off-Shore Renewable Energy Project, Global Insight for Cape Wind Associates, 2003.

Economic Impact of Renewable Energy in Pennsylvania, prepared for the Heinz Endowments and Community Foundation of the Alleghenies by Black & Veatch, 2004.

Economic Impacts of Wind Power in Kittitas County: Final Report: A Report for the Phoenix Economic Development Group, ECONorthwest, 2002.

Energy for Washington's Economy: Economic Development from Energy Efficiency and Wind Power in Washington, Brad Heavner, Robert Pregulman, Travis Madsen for WashPIRG Foundation, 2003.

Pecos County Wind Farms: Local Economic Impact.

Potential Economic Impacts of Commercial Wind Power Development in North Dakota, F. Larry Leistritz for Griggs/Steele Wind Power Development Group LLC, 2001.

Renewable Resources: The New Texas Energy Powerhouse: A report on the economic benefits of renewable energy in Texas and how to keep them growing, SEED Coalition and Public Citizen's Texas Office and Virtus Energy Research Associates, 2002.

Renewables Work: Job Growth from Renewable Energy Development in California, Brad Heavner and Susannah Churchill for CALPIRG Charitable Trust, 2002.

Rural Economic Development Impacts of Wind Power: Foote Creek Rim Projects (PowerPoint presentation), Mike Azeka for SeaWest WindPower.

Strong Winds: Opportunities for rural economic development blow across Nebraska, Steven Clemmer, Union of Concerned Scientists, 2001.

Wind Energy: Powering Economic Development for Colorado, Travis Madsen, Stephanie Bonin, Matt Baker (Colorado Public Interest Research Foundation), 2002.

Studies Not Included in Report

A Brief Analysis of the Economic Benefits of Wind Power in Washington State, Washington State Office of Trade & Economic Development, 2003.

The Economic Impacts of Wind Energy Use in Wisconsin, Steven L. Clemmer, Wisconsin Department of Administration, Energy Bureau.

Fueling Wisconsin's Economy with Renewable Energy, Steve Clemmer, Wisconsin Department of Administration, Energy Bureau, 1995.

Citation	The Economic Benefits of Wind Farm Development in Vermont				
Author(s)	Prepared by: Doug Hoffer for Renewable Energy Vermont				
Date of Report	Ocotber 2002				
Available Online?	http://www.revern	http://www.revermont.org/windfarm_benefits.pdf			
Description	Project Size: 228 M	Project Size: 228 MW Number of Turbines: 152			
	6 locations to be determined, but may include Searsburg, Mount Equinox in Manchester, East				
Location	Haven in the North	neast Kingdom			
Geographic Scope	Vermont				
Turbine Ownership	N/A				
Type of Study	Prospective				
Timeframe of Data	10 Years				
Methodology					
Model	RIMS II				
Data Sources	determine the expe	ected changes in job creation and earni Tax Department, the average annual v	re applied to the relevant industries to ings; net state taxes calculated using wage for each FTE job, and a program		
Assumptions Special	Cost of installed turbine (including raodways, power lines and development costs): \$2.25 million per turbine. Aggregate cost of project: \$342 million (2002 dollars). Development/permitting phase: 5 years. Installation phase: 7 years. Professional services and much of the electrical and mechanical equipment can be purchased in Vermont; ideally local lenders. Expenditures inflated annually at 2.5%. Sales tax data from year one. Annual sale of 600,000 MW at 5.6 cents/kWh is assumed. Lease payments are assumed to be 8% of gross revenues. Property taxes calculated as 6.5% of gross revenues. Tax profit of 9% assumed for annual state tax payments. Report analyzes the economic benefits of meeting 10% of Vermont's electric needs from wind power with a 10-year development period. Construction jobs and income include development phase and therefore the number of jobs is an average of the number of jobs created each year				
Considerations	over the 10 year development period.

Other Remuneration N/A

There will be a number of positive economic and fiscal impacts during the
manufacturing/assembly and construction/installation phase of the project; these positive impacts
will extend beyond the M/A and C/I phase. In the long run, there should be no appreciable
increase in the demand for locally or state provided government services. Overall, the study
forecasts that the operation and maintenance of Cape Wind Farm would have a positive effect on
the economy of both Barnstable County and Massachusetts.

Available Online? http://www.environmentcolorado.org/reports/windenergy11_02.pdf  Description Project Size: 1,800 MW Number of Turbines: N/A  Total Ocation  Colorado  Geographic Scope Turbine Ownership Type of Study Prospective Timeframe of Data Methodology  Model N/A  Data Sources  Electric Power Research Institute; Wind turbines will be able to operate more efficiently over the next 20 years; capacity factors are assumed to increase one percent every two years, average capacity in 2002: 30%. Building cost/MW: \$900,000. Manufacturing and installation: every MW of wind energy capacity installed creates 2.06 year-long manufacturing jobs; 10% of manufacturing will happen in-state; every MW of wind energy capacity in 2002: 30%. Building cost/MW: \$900,000. Manufacturing jobs; 10% of manufacturing will happen in-state; every MW of wind energy capacity in stalled creates 9.0% of these jobs are estimated to be installation and 80% to be a manufacturing operations. Walminetonace: poperations will happen in-state; every MW of wind energy capacity in stalled creates 9.0% of these jobs are estimated to be installation and 80% to be a manufacturing operations. Walminetonace: poperations will happen in-state; every MW of wind energy capacity jobs are one-year Malientonace: poperations. Walminetonace: poperations will happen in-state; every MW of wind energy capacity jobs are created for every direct wind energy job.  Assumptions  Assumptions  Report is based on a conservative scenario in which Colorado include inflation or discount estimates. Property tax: uses the average Colorado county property tax rate of 1.59%.  Considerations  Special  Considerations  Ocorado's Ibo.  Colorado's Ibo.		1 2					
Description   Project Size: 1,800 MW   Number of Turbines: N/A		11.12					
Location   Colorado		•	C 1 C.	'F "			
Geographic Scope Turbine Ownership Type of Study Type of Study Model N/A Data Sources  Electric Power Research Institute; Wind turbines will be able to operate more efficiently over the next 20 years; capacity factors are assumed to increase one percent every two years, average capacity in 2002; 30%. Building cost/MW: \$900,000. Manufacturing and installation: every MW of wind energy capacity installed creates 2.06 year-long manufacturing; jobs; 10% of manufacturing will happen in-state; every MW of wind energy capacity installed creates 2.06 year-long manufacturing; jobs; 20% of these jobs are estimated to be installation and 80% to be manufacturing. Operations & Maintenance: "operations" jobs are long-term and include operation and maintenance; every 6.04 WW of expacity requirers one full-time employee to operate, monitor and service it. Indirect jobs: 1.15 indirect jobs are created for every direct wind energy job. Landowner income: estimated at 2.5% of the yearly sale of electricity at 3 cents/kWh, scalating with projected growth in wind power use. Future dollar values do not include inflation or discount estimates. Property tax: uses the average Colorado county property tax rate of 1.59%.  Report is based on a conservative scenario in which Colorado wind power meets half of new demand through the next ten years (5,110 GWh or 10% of Colorado's total electricity needs; and then three-quarters of new demand in the following decade (12,600 GWh/year by 2020 or 20% of Colorado's total electricity needs; see "Wind Energy: Powering Economic Development for Colorado' 1b). Jobs		with projected growth in wind power use. Future dollar values do not include inflation or discount					
Report is based on a conservative scenario in which Colorado wind power meets half of new demand through the next ten years (5,110 GWh or 10% of Colorado's total electricity needs) and then three-quarters of new demand in the following decade (12,600 GWh/year by 2020 or 20% of Colorado's total electricity needs; see "Wind Energy: Powering Economic Development for Colorado" 1b). <b>Developer Incentives</b>	Varying tax rate for renewables (not yet implemented).			
<b>Lease Payments</b>	\$20,000,000			
Other Remuneration	Conservation of <b>6.8 billion</b> gallons of water (when compared with natural gas), with water rights worth more than <b>\$47 million</b> at current Front Range prices; in-state manufacturing for wind farms could create <b>840</b> person-years of manufacturing employment through 2020 (payroll value of these jobs would be <b>\$33 million</b> ).			
Conclusion	Meeting new electricity demand with wind power instead of natural gas would result in roughly twice the total economic benefit to Colorado over the next two decades. Wind power could provide 70% more one-year jobs and more than three times as many permanent jobs as natural gas. Wind power could also provide property tax payments to local governments distributed across a wider area of the state, conserve water that natural gas plants would otherwise consume, and pay royalties to farmers, ranchers and other rural landowners.

<b>Developer Incentives</b>	Varying tax rate for renewables (not yet implemented).					
<b>Lease Payments</b>	\$76,000,000 (or \$9,400,000/year)					
	Conservation of more than <b>25 billion</b> gallons of water (when compared with natural gas), with					
Other Remuneration	water rights worth more than \$120 million at current Front Range prices.					
	Meeting new electricity demand with wind power instead of natural gas would result in roughly					
	twice the total economic benefit to Colorado over the next two decades. Wind power could					
	provide 70% more one-year jobs and more than three times as many permanent jobs as natural gas.					
	Wind power could also provide property tax payments to local governments distributed across a					
	wider area of the state, conserve water that natural gas plants would otherwise consume, and pay					
Conclusion	royalties to farmers, ranchers and other rural landowners.
